Note: 1. The ZQ ball on each DDR4 component is connected to an external 240Ω ±1% resistor that is tied to ground. It is used for the calibration of the component's ODT and output driver.

## 6. SDRAM Absolute Maximum Ratings

Symbol	Parameter	Rating	Units	Note	
T <sub>OPER</sub>	Operation Temperature	Normal Operating Temp.	0 to 85	°C	1,2
		Extended Temp.	85 to 95	°C	1,3
T <sub>STG</sub>	Storage Temperature	-55 to 100	°C	4,5	
V <sub>IN</sub> , V <sub>OUT</sub>	Voltage on any pins relative to V <sub>SS</sub>	-0.3 to +1.5	V	4	
V <sub>DD</sub>	Voltage on VDD supply relative to V <sub>SS</sub>	-0.3 to +1.5	V	4,6	
V <sub>DDQ</sub>	Voltage on VDDQ supply relative to V <sub>SS</sub>	-0.3 to +1.5	V	4,6	

### Note:

- 1) Operating Temperature T<sub>OPER</sub> is the case surface temperature on the center/top side of the DRAM.
- 2) The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0-85°C under all operating conditions.
- 3) Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
  - a) Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9us.
  - b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b), in this case IDD6 current can be increased around 10~20% than normal Temperature range.
4. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
5. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
6. VDD and VDDQ must be within 300 mV of each other at all times; and VREF must be not greater than 0.6 x VDDQ, When VDD and VDDQ are less than 500 mV; VREF may be equal to or less than 300 mV

## 7. Operating Condition

Symbol	Parameter	Min	Nom	Max	Units	Notes
VDD	Supply Voltage	1.14	1.2	1.26	V	1
VPP	DRAM activating power supply	2.375	2.5	2.75	V	2
VREFCA(DC)	Input reference voltage command/ address bus	0.49 x VDD	0.5 x VDD	0.51 x VDD	V	3
VTT	Termination Voltage	0.49 x VDD	0.5 x VDD	0.51 x VDD	V	4

**Note:**

- VDDQ tracks with VDD; VDDQ and VDD are tied together.
- VPP must be greater than or equal to VDD at all times.
- VREFCA must not be greater than 0.6 x VDD. When VDD is less than 500mV, VREF may be less than or equal to 300mV.
- VTT termination voltages in excess of the specification limit adversely affect the voltage margins of command and address signals and reduce timing margins.
