6. SDRAM Absolute Maximum Ratings

| Symbol | Parameter | Rating | Units | Note | |
|------------------------------------|--|-----------------|----------|------|-----|
| T _{OPER} | Operation Temperature | Operating Temp. | 0 to 85 | °C | 1,2 |
| | | Extended Temp. | 85 to 95 | °C | 1,3 |
| V _{IN} , V _{OUT} | Voltage on any pins relative to V _{ss} | -0.4 to +1.975 | V | 4 | |
| V _{DD} | Voltage on VDD supply relative to V _{ss} | -0.4 to +1.975 | V | 4,6 | |
| V _{DDQ} | Voltage on VDDQ supply relative to V _{ss} | -0.4 to +1.975 | V | 4,6 | |

Note:

- Operating Temperature T_{OPER} is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 to 85 °C under all operating conditions.
- Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9us.
 - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b), in this case IDD6 current can be increased around 10~20% than normal Temperature range.
- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
- V_{DD} and V_{DDQ} must be within 300 mV of each other at all times; and VREF must be not greater than 0.6 x V_{DDQ}, When V_{DD} and V_{DDQ} are less than 500 mV; VREF may be equal to or less than 300 mV

Note:

1. Under all conditions VDDQ must be less than or equal to VDD.
2. VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.
3. For DQ and DM, Vref = VrefDQ. For input only pins except RESET#, Vref = VrefCA.
4. Recommended DC Operating Conditions - DDR3 (1.5V) operation : The ac peak noise on VRef may not allow VRef to deviate from VRef(DC) by more than +/-1% VDD (for reference: approx. +/- 15 mV); Recommended DC Operating Conditions - DDR3L (1.35V) operation: The ac peak noise on VRef may not allow VRef to deviate from VRef(DC) by more than +/-1% VDD (for reference: approx. +/- 13.5 mV)
5. For reference: approx. VDD/2.
6. The swing of $\pm 0.1 \times VDDQ$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = VDDQ/2$
7. Used to define a differential signal slew-rate.
8. For CK - CK# use VIH/VIL(ac) of ADD/CMD and VREFCA; for DQS - DQS#, DQSL, DQSL#, DQSU, DQSU# use VIH/VIL(ac) of DQs and VREFDQ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
9. These values are not defined, however the single-ended signals CK, CK#, DQS, DQS#, DQSL, DQSL#, DQSU, DQSU# need to be within the respective limits (VIH(dc) max, VIL(dc)min) for single-ended signals as well as the limitations for overshoot and undershoot.
10. The swing of $\pm 0.2 \times VDDQ$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = VDDQ/2$ at each of the differential outputs.
