8. DRAM Absolute Maximum Ratings

Symbol	Parameter	Rating	Units	Note	
T _{OPER}	Operation Temperature	Normal Operating Temp.	0 to 85	°C	1,2
		Extended Temp.(optional)	85 to 95	°C	1,3
T _{STG}	Storage Temperature	-55 to 100	°C	4,5

V _{DDQ}	Voltage on VDDQ supply relative to V _{ss}	-0.4 to +1.975	V	4,6	

Note:

1. Operating Temperature T_{OPER} is the case surface temperature on the center / top side of the DRAM.

For measurement conditions, please refer to the JEDEC document JESD51-2.

2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 to 85 °C under all operating conditions.

3. Some applications require operation of the DRAM in the Extended Temperature Range between 85 °C and 95 °C case temperature. Full specifications are supported in this range, but the following additional conditions apply:

- a) Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 μs. It is also possible to specify a component with 1X refresh (tREFI to 7.8μs) in the Extended Temperature Range. Please refer to supplier data sheet and/or the DIMM SPD for option availability.
- b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 =0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 =0b). Please refer to the supplier data sheet and/or the DIMM SPD for Auto Self-Refresh option availability, Extended Temperature Range support and tREFI requirements in the Extended Temperature Range.

4. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

5. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

6. V_{DD} and V_{DDQ} must be within 300 mV of each other at all times;and V_{REF} must be not greater than 0.6 x V_{DDQ}, When V_{DD} and V_{DDQ} are less than 500 mV; V_{REF} may be equal to or less than 300 mV

Note:						
<ol style="list-style-type: none"> Under all conditions V_{DDQ} must be less than or equal to V_{DD}. V_{DDQ} tracks with V_{DD}. AC parameters are measured with V_{DD} and V_{DDQ} tied together. For DQ and DM, V_{ref} = V_{refDQ}. For input only pins except RESET#, V_{ref} = V_{refCA}. The ac peak noise on V_{Ref} may not allow V_{Ref} to deviate from V_{Ref(DC)} by more than +/-1% V_{DD} (for reference: approx. +/- 15 mV). For reference: approx. V_{DD}/2 +/- 15 mV. The swing of ± 0.1 × V_{DDQ} is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40 Ω and an effective test load of 25 Ω to V_{TT} = V_{DDQ}/2 Used to define a differential signal slew-rate. For CK - CK# use V_{IH}/V_{IL}(ac) of ADD/CMD and V_{REFCA}; for DQS - DQS#, DQSL, DQSL#, DQSU, DQSU# use V_{IH}/V_{IL}(ac) of DQs and V_{REFDQ}; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here. These values are not defined, however the single-ended signals CK, CK#, DQS, DQS#, DQSL, DQSL#, DQSU, DQSU# need to be within the respective limits (V_{IH}(dc) max, V_{IL}(dc)min) for single- ended signals as well as the limitations for overshoot and undershoot. The swing of ± 0.2 × V_{DDQ} is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40 Ω and an effective test load of 25 Ω to V_{TT} = V_{DDQ}/2 at each of the differential outputs.
